

## General results about the density of a specific order statistic

Consider  $U_1, U_2, \dots, U_n$  that are independent, continuous Uniform random variables on  $[a, b]$ , and suppose we want the density of  $U_{(j)}$  i.e. of the  $j$ th smallest of the  $U$ 's.

$$f_{U_{(j)}}(u) = \binom{n}{j-1, 1, n-j} \left(\frac{1}{b-a}\right) \left(\frac{u-a}{b-a}\right)^{j-1} \left(1 - \frac{u-a}{b-a}\right)^{n-j} \quad \text{for } a < u < b$$

$\frac{n!}{(j-1)! 1! (n-j)!}$

In particular if  $[a, b] = [0, c]$

$$f_{U_{(j)}}(u) = \binom{n}{j-1, 1, n-j} \left(\frac{1}{c}\right) \left(\frac{u}{c}\right)^{j-1} \left(1 - \frac{u}{c}\right)^{n-j} \quad \text{for } 0 < u < c$$

Now consider  $X_1, X_2, \dots, X_n$  which are independent Exponential random variables, each with parameter  $\lambda$  i.e.  $E(X_j) = \frac{1}{\lambda}$  for each  $j$ .

Find the density of  $X_{(j)}$  i.e. of the  $j$ th order statistic:

$$f_{X_{(j)}}(x) = \binom{n}{j-1, 1, n-j} (\lambda e^{-\lambda x}) (1 - e^{-\lambda x})^{j-1} (e^{-\lambda x})^{n-j} \quad \text{for } x > 0$$

Notice: If  $j \neq 1$ , then  $X_{(j)}$  is not exponential

If  $j=1$  i.e. if we look at the min,

$$f_{X_{(1)}}(x) = \binom{n}{0, 1, n-1} (\lambda e^{-\lambda x}) (1 - e^{-\lambda x})^0 (e^{-\lambda x})^{n-1} = n\lambda e^{-n\lambda x} \quad \text{for } x > 0$$

$\frac{n!}{(n-1)!} = n$

So  $X_{(1)}$  i.e. the minimum of  $X_1, \dots, X_n$  is an exponential random variable with parameter  $n\lambda$  i.e.  $E(X_{(1)}) = \frac{1}{n\lambda}$ .
