Solutions by Mark Daniel Ward

We always use Z to denote a standard normal random variable in these answers.

1a. We have $\mathbb{E}(Y) = \mathbb{E}\left(\frac{X_1+X_2+X_3+X_4+X_5}{5}\right) = \frac{1}{5}(\mathbb{E}(X_1)+\cdots+\mathbb{E}(X_5)) = \frac{1}{5}(8.2+\cdots+8.2) = 8.2$. The X_j 's are independent, so $\text{Var}(Y) = \text{Var}\left(\frac{X_1+X_2+X_3+X_4+X_5}{5}\right) = \frac{1}{25}(\text{Var}(X_1)+\cdots+\text{Var}(X_5)) = \frac{1}{25}(32.49 + \cdots + 32.49) = \frac{32.49}{5} = 6.498$.

1b. We have $\mathbb{E}(Y) = \mathbb{E}\left(\frac{X_1+X_2+\cdots+X_n}{n}\right) = \frac{1}{n}(\mathbb{E}(X_1) + \cdots + \mathbb{E}(X_n)) = \frac{1}{n}(\mu + \cdots + \mu) = \mu$. The X_j 's are independent, so $\text{Var}(Y) = \text{Var}\left(\frac{X_1+X_2+\cdots+X_n}{n}\right) = \frac{1}{n^2}(\text{Var}(X_1) + \cdots + \text{Var}(X_n)) = \frac{1}{n^2}(\sigma^2 + \cdots + \sigma^2) = \frac{\sigma^2}{n}$.

2. Let Y_1, Y_2, Y_3 be the amounts in the three people's accounts. So $X = Y_1 + Y_2 + Y_3$. So X is the sum of independent normals, and thus X is normal too, with $\mathbb{E}(X) = \mathbb{E}(Y_1 + Y_2 + Y_3) = \mathbb{E}(Y_1) + \mathbb{E}(Y_2) + \mathbb{E}(Y_3) = 1325 + 1325 + 1325 = 3975$, and $\text{Var} X = \text{Var}(Y_1 + Y_2 + Y_3) = \text{Var}(Y_1) + \text{Var}(Y_2) + \text{Var}(Y_3) = 25^2 + 25^2 + 25^2 = 1875$, so $\sigma_X = 43.30$. Thus $P(X > 4000) = P\left(\frac{X-3975}{43.30} > \frac{4000-3975}{43.30}\right) = P(Z > .58) = 1 - P(Z \leq .58) = 1 - .7190 = .2810$.

3. Let X_1, X_2, X_3, X_4 be the lengths of time for the four people's haircuts. So $Y = X_1 + X_2 + X_3 + X_4$ is the total length of time. So Y is the sum of independent normals, and thus Y is normal too, with $\mathbb{E}(Y) = \mathbb{E}(X_1 + X_2 + X_3 + X_4) = \mathbb{E}(X_1) + \mathbb{E}(X_2) + \mathbb{E}(X_3) + \mathbb{E}(X_4) = 23.8 + 23.8 + 23.8 + 23.8 = 95.2$, and $\text{Var} Y = \text{Var}(X_1 + X_2 + X_3 + X_4) = \text{Var}(X_1) + \text{Var}(X_2) + \text{Var}(X_3) + \text{Var}(X_4) = 5^2 + 5^2 + 5^2 + 5^2 = 100$, so $\sigma_Y = 10$. Thus $P(Y \leq 90) = P\left(\frac{Y-95.2}{10} \leq \frac{90-95.2}{10}\right) = P(Z \leq -.52) = P(Z \geq .52) = 1 - P(Z < .52) = 1 - .6985 = .3015$.

4. As in problem 1b above, $\mathbb{E}(Y) = 64$, and $\text{Var}(Y) = \frac{12.8^2}{10} = 16.384$, so $P(Y > 60) = P\left(\frac{Y-64}{\sqrt{16.384}} > \frac{60-64}{\sqrt{16.384}}\right) = P(Z > -0.99) = P(Z < 0.99) = .8389$.

5. Let $Y = X_1 + \cdots + X_7$ be the total quantity of sugar, where X_j is the amount of sugar in the j th piece. So Y is the sum of independent normals, and thus Y is normal too, with $\mathbb{E}(Y) = \mathbb{E}(X_1 + \cdots + X_7) = \mathbb{E}(X_1) + \cdots + \mathbb{E}(X_7) = 22 + \cdots + 22 = 154$, and $\text{Var} Y = \text{Var}(X_1 + \cdots + X_7) = \text{Var}(X_1) + \cdots + \text{Var}(X_7) = 8 + \cdots + 8 = 56$, so $\sigma_Y = 7.48$. Thus $P(Y \geq 150) = P\left(\frac{Y-154}{7.48} \geq \frac{150-154}{7.48}\right) = P(Z \geq -.53) = P(Z \leq .53) = .7019$.
